Received 7 February 2012; accepted 14 February 2012

 Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.037;  $wR$  factor = 0.094; data-to-parameter ratio = 7.8.

The molecule of the title compound,  $\text{C}_{25}\text{H}_{31}\text{NO}_3$ , exists in a twin-chair conformation with an equatorial orientation of the 4-ethoxyphenyl groups, as observed for its *ortho* isomer [Parthiban, Ramkumar, Park & Jeong (2011*b*), *Acta Cryst. E* **67**, o1475–o1476]. The methyl and 4-ethoxyphenyl groups are also equatorially oriented on the bicycle, as in the *ortho* analogue. In particular, although the cyclohexanone ring deviates from an ideal chair, the piperidone ring is closer to an ideal chair, whereas in the *ortho* isomer both rings are significantly puckered and deviate from ideal chairs. The 4-ethoxyphenyl groups on both sides of the secondary amine group are oriented at an angle of  $26.11(3)^\circ$  with respect to each other, but the 2-ethoxyphenyl groups in the *ortho* isomer are oriented by less than half this [ $12.41(4)^\circ$ ]. In contrast to the absence of any significant interactions in the crystal packing of the *ortho* isomer, the title compound features  $\text{N}\cdots\text{H}\cdots\text{O}$  interactions, linking the molecules along the  $b$  axis.

## 2,4-Bis(4-ethoxyphenyl)-7-methyl-3-azabicyclo[3.3.1]nonan-9-one

Dong Ho Park, V. Ramkumar and P. Parthiban

### S1. Comment

The 3-azabicyclononane nucleus is an important class of pharmacophore due to its broad-spectrum of biological actions ranging from antibacterial to anticancer (Barker *et al.*, 2005; Parthiban *et al.*, 2009, 2010*a,b*, 2011*a*). Owing to their broad-spectrum of biological actions, synthesis as well as isolation of new molecules from the natural products, and their stereochemical analysis are considered as important in the field of medicinal chemistry. Hence, we synthesized the title compound by a modified and an optimized successive double Mannich condensation. Thus the obtained crystal was undertaken for this study to explore its stereochemistry in the solid-state.

The crystallographic parameters *viz.* torsion angles, asymmetry parameters and ring puckering parameters calculated for the title compound show that the piperidone ring adopts a near ideal chair conformation, according to Cremer & Pople and Nardelli (Fig. 1). The total puckering amplitude,  $Q_T$  is 0.607 (6) Å, the phase angle  $\theta$  is 7.7 (6)° and  $\varphi$  is 180.0° (Cremer & Pople, 1975). The smallest displacement asymmetry parameters  $q_2$  and  $q_3$  are 0.081 (6) Å and 0.601 (6) Å, respectively (Nardelli, 1983). On the other hand, the cyclohexane ring deviates from the ideal chair conformation by  $Q_T = 0.536$  (6),  $\theta = 170.2$  (7)° and  $\varphi = 240.0$ ° (Cremer & Pople, 1975) as well as Nardelli by  $q_2 = 0.092$  (7) and  $q_3 = 0.528$  (6)° (Nardelli, 1983). In its *ortho* isomer, that is, 2,4-bis(2-ethoxyphenyl)-7-methyl-3-azabicyclo[3.3.1]nonan-9-one (Parthiban *et al.*, 2011*b*), both the piperidone and cyclohexanone rings deviated the ideal chair as follows ( $Q_T = 0.5889$  (18),  $\theta = 7.19$  (18)° and  $Q_T = 0.554$  (2),  $\theta = 12.2$  (2)°, respectively).

The aryl groups are orientated at an angle of 26.11 (3)° to each other. The center of symmetry passes through C6 C5 C3 N1 and O1. The torsion angle of C3—C2—C1—C7 and its mirror image is -176.7 (5)°. The angle with C&P plane normal of bonds C1—C7 as well as C1a—C7a and C5—C6 are 73.27 and 65.36 (2), respectively, conforms the equatorial disposition of the aryl and alkyl groups on the bicycle. Hence, the title compound  $C_{25}H_{31}NO_3$ , exists in a double-chair conformation with an equatorial orientation of the 4-ethoxyphenyl groups on both sides of the secondary amino group on the heterocycle and exocyclic orientation of the methyl on the cyclohexane ring.

The crystal packing is stabilized by an intermolecular N—H⋯O interaction of 2.26 (2) Å (Table 1 and Fig. 2).

### S2. Experimental

The 2,4-bis(4-ethoxyphenyl)-7-methyl-3-azabicyclo[3.3.1]nonan-9-one was synthesized by a modified and an optimized Mannich condensation in one-pot, using 4-ethoxybenzaldehyde (0.1 mol, 15.018 g/13.91 ml), cyclohexanone (0.05 mol, 5.61 g/6.14 ml) and ammonium acetate (0.075 mol, 5.78 g) in a 50 ml of absolute ethanol (Park *et al.*, 2001). The mixture was gently warmed on a hot plate at 303–308 K (30–35° C) with moderate stirring till the complete consumption of the starting materials, which was monitored by TLC. At the end, the crude azabicyclic ketone was separated by filtration and gently washed with 1:5 cold ethanol–ether mixture. X-ray diffraction quality crystals of the title compound were obtained by slow evaporation from ethanol.

### S3. Refinement

The nitrogen H atom and C6 H atoms were located by difference Fourier map and refined isotropically. Other H atoms were fixed geometrically and allowed to ride on the parent C atoms with aromatic C—H = 0.93 Å, aliphatic C—H = 0.98 Å and methylene C—H = 0.97 Å. The displacement parameters were set for phenyl, methylene and aliphatic H atoms at  $U_{iso}(H) = 1.2U_{eq}(C)$  and for methyl H atoms at  $U_{iso}(H) = 1.5U_{eq}(C)$ . Because of the meaningless of the absolute structure parameter, 400 Friedel-pairs were merged before final refinement

**Figure 1**

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
