Cu-catalyzed in situ generation of thiol using xanthate as thiol surrogate for the one-pot synthesis of benzothiazoles and benzothiophenes†

D. J. C. Prasad and G. Sekar*

Received (in XXX, XXX) Xth XXXXXXXXX 20XX, Accepted Xth XXXXXXXX 20XX 5 DOI: 10.1039/b000000x

A new copper-catalyzed in situ generation of aryl thiolates strategy was successfully developed for the one-pot synthesis of substituted benzothiazoles from 2-iodoanilides using xanthate as thiol precursor. A wide range of 2-iodoanilides with both electron-releasing and electron-withdrawing groups produced the corresponding benzothiazoles in good yields. Further, this one-pot protocol was successfully utilized for the synthesis of a potent antitumor agent 2-(3,4-dimethoxyphenyl)-5-fluorobenzo[d]thiazole (PMX 610). Finally, copper-catalyzed in situ generation of aryl thiolates strategy was successfully applied for the domino synthesis of substituted benzothiophenes from o-haloalkynyl benzenes using xanthate as thiol precursor.

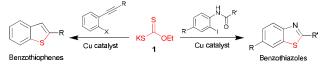

Introduction

15 Benzofused sulfur-containing heterocycles are important class of compounds in pharmaceuticals, biologically active molecules and materials. Particularly, benzothiazole and benzothiophene motifs can be found in numerous biologically important molecules such as antitumor agents,² fatty acid amide hydrolase inhibitors³ and 20 selective estrogen receptor modulators (SERM's) (Fig. 1).

Fig. 1 Biologically active molecules containing benzothiazole and benzothiophene skeleton.

See DOI: 10.1039/b000000x/

The common methods reported in the literature for the construction of benzothiazole moieties are condensation of 2different electrophiles,5 35 aminothiophenols with functionalized cyclization of thiobenzanilide⁶ and transition metal-cnatalyzed intramolecular cyclization of 2-halophenyl benzothioamide. But, these methods are associated with several limitations like usage of readily oxidizable substituted 2-40 aminothiophenols, formation of regioisomers, limited substrate scope, and high cost of Pd catalysts. In general, thioamides are prepared from the corresponding amides using P₄S₁₀ or Lawessons reagent, but it is not feasible for substrates consist of ketone, ester, and amide moieties. The development of Pd or Cu-45 catalyzed one-pot synthesis of benzothiazoles from 2-haloanilides and a thiol surrogate has overcome these difficulties to a great extent.8 Towards our ongoing research in developing newer methods for the copper-catalyzed C(arvl)-heteroatom bond formation and its application in heterocycles synthesis,⁹ recently 50 we have reported a one-pot protocol for the synthesis of aryl thioethers using potassium ethyl xanthogenate (xanthate) 1 as thiol surrogate. 10 To extend the application of our coppercatalyzed in situ generation of aryl thiolate strategy, herein, we report a one-pot protocol for the synthesis of benzothiazoles and 55 benzothiophenes using xanthate 1 as a sole thiol precursor (Scheme 1).

Results and Discussion

We started our studies by reacting N-(2-iodophenyl) benzamide 2 with xanthate 1 in the presence of 10 mol\% Cu(OAc)₂ and 10 mol% of 1,1'-binaphthyl-2,2'-diamine (BINAM) ligand at 105 °C. 5 After 10 hours, N-(2-iodophenyl)benzamide 2 was completely consumed, then 0.5 mL of concentrated HCl was added to the reaction mixture and stirred for 8 hours at room temperature to obtain 24% isolated yield of 2-phenylbenzothiazole 3 along with 20% of 2-phenylbenzoxazole (Table 1, entry 1). When the one-10 pot reaction was carried out without BINAM ligand, in the presence of only Cu(OAc)₂, the reaction provided 42% yield of 2phenylbenzothiazole 3 (entry 2). Similar result was obtained when the reaction was carried out at 80 °C with slightly longer reaction time (entry 3). To increase the efficiency of this one-pot 15 synthesis of benzothiazoles, the amount of xanthate 1 was increased to three equivalents and as a result, a better yield of 62% was obtained (entry 4). Either by changing the copper salt or using external base, the yield for benzothiazole formation decreased (entries 5 and 6). Trace amount of product 3 was 20 observed when the reaction was carried out without Cu(OAc)2 (entry 7).

Using the above mentioned optimized reaction conditions, we initiated our investigation into the scope of the coppercatalyzed one-pot synthesis of substituted benzothiazoles with a variety of substituted 2-iodoanilides and xanthate 1 as thiol 30 precursor and the results are summarized in Table 2. A wide range of 2-iodoanilides with both electron-releasing (entries 2 and 3) and electron-withdrawing groups (entries 5) produced the corresponding benzothiazoles in good yields. Sterically hindered ortho-substituted benzothioamide 8 also provided 35 corresponding benzothiazole 9 in good yield (entry 4). Interestingly, 2-alkyl-substituted benzothiazoles were also synthesized in good yields (entries 7 and 8). We were pleased to note that under the optimized reaction conditions, 2-iodoanilides containing functional groups such as ketone and ester also 40 provided the corresponding benzothiazoles in good yields (entries 9 and 10).

After completion of a wide range of substituted benzothiazoles synthesis, the one-pot protocol was successfully applied for the synthesis of a potent antitumor agent (PMX 610) 45 2-(3,4-dimethoxyphenyl)-5-fluorobenzo[d]thiazole 25 where 2arylbenzo[d]thiazole formation is the key step (Scheme 2). N-(5-Fluoro-2-iodophenyl)-3,4-dimethoxybenzamide 24 was obtained with 87% yield through acylation of 5-fluoro-2-iodoaniline 22 with 3,4-dimethoxybenzoyl chloride 23. Next, we applied copper-50 catalyzed one-pot protocol by reacting N-(5-fluoro-2iodophenyl)-3,4-dimethoxybenzamide 24 and xanthate 1 as a thiol precursor. The reaction provided the target molecule 2-(3,4-dimethoxyphenyl)-5-fluorobenzo[*d*] antitumor agent thiazole 25 in 64% isolated yield.

The plausible reaction pathway for one-pot synthesis of 60 benzothiazoles is proposed in Scheme 3.8b First, there will be a copper-catalyzed Ullmann type C(arvl)-S bond formation between 2-iodoanilide 26 with xanthate 1 (xanthate coupling) to give aryl xanthate 27. Subsequently, this aryl xanthate 27 will be

25

hydrolyzed by excess xanthate 1 to generate the corresponding aryl thiolate 28 and this in situ generated thiolate underwent intramolecular condensation to give the corresponding substituted benzothiazole 30 (Scheme 3). In this one-pot process the in situ 5 generation of aryl thiolate 28 was confirmed by trapping with an electrophile (benzyl bromide).11

Scheme 2 Synthesis of antitumor agent (PMX 610) using thiol precursor.

10 Scheme 3 Plausible reaction pathway for one-pot synthesis

Finally, we extended this in situ generation of aryl thiolates methodology for domino synthesis of substituted benzothiophenes from o-haloalkynylbenzenes and xanthate 1 as 15 thiol precursor. The common methods reported in the literature for the assembly of benzothiophene moieties are electrophilic cyclization reaction of o-alkynylaryl thioether derivatives, 12 intramolecular S-arylation of α -(ortho-haloaryl)thioketones¹³ and domino Sonogashira coupling between o-bromothiophenol and 20 cuprous acetylide followed by cyclization. 14 But, these methods associated with some limitations like usage of readily oxidizable 2-bromothiophenols, limited substrate scope, moderate yields and high costs of palladium catalysts. The development of transition metal catalyzed one-pot or domino synthesis of benzothiophenes 25 from o-haloalkynylbenzenes and a thiol precursor has overcome these difficulties to a great extent.¹⁵

Initially, the domino reaction was carried out with 1-iodo-2-(phenylethynyl)benzene 31 and xanthate 1 in the presence of 10 mol% of Cu(OAc)2 and 10 mol% of BINAM in DMF at 100 °C 30 and the reaction provided 94% of 2-phenylbenzothiophene 32 (Table 3, entry 1). Similar result was obtained when the reaction was carried out at 80 °C with slightly increased yield (entry 2). The domino reaction provided only 38% of 32 when only Cu(OAc), was used as catalyst without ligand BINAM (entry 4).

Using the optimized reaction conditions, a variety of substituted 2-iodoalkynylbenzenes were reacted with xanthate 1 for the domino synthesis of benzothiophenes (Table 4). All types

of 2-iodo alkynylbenzenes including electron-releasing, electronwithdrawing and sterically hindered ortho-substituted 2-40 iodoalkynylbenzenes are well tolerated. Heteroatom containing 2-((2-iodophenyl)ethynyl) pyridine 43 also provided 93% isolated vield for the corresponding benzothiophene 44 (entry 7). Less reactive 2-bromoalkynylbenzenes were also used for this domino reaction by slightly increasing the reaction temperature to 100 °C 45 (entries 8-10).

The plausible reaction pathway for domino synthesis of benzothiophenes from o-iodoalkynylbenzenes and xanthate 1 is proposed in Scheme 4.15c Initially, there will be a copper catalyzed Ullmann type C(arvi)-S bond formation between o-5 iodoalkynylbenzene 48 with xanthate 1 (xanthate coupling) to give intermediate 49. The aryl thiolate 50 is in situ generated through the hydrolysis of intermediate 49, which then underwent intramolecular cyclization to yield the analogous benzothiophene 51 (Scheme 4).

Conclusion

Published on 08 January 2013 on http://pubs.rsc.org | doi:10.1039/C3OB26915A

Downloaded by University of Arizona on 11 January 2013

We have developed a new copper-catalyzed copper-catalyzed in 15 situ generation of aryl thiolates strategy for the one-pot synthesis of substituted benzothiazoles from 2-iodoanilides and xanthate as thiol precursor. A wide range of 2-iodoanilides with both electron-releasing and electron-withdrawing groups produced the corresponding benzothiazoles in good yields. Further, this one-20 pot protocol was successfully utilized for the synthesis of a potent 2-(3,4-dimethoxyphenyl)-5-fluorobenzo[d] antitumor agent thiazole (PMX 610). Finally, copper-catalyzed in situ generation of aryl thiolates strategy was successfully applied for the domino synthesis of substituted benzothiophenes from o-haloalkynyl 25 benzenes and xanthate as a sole thiol precursor.

Experimental Section

General information

1,1'-Binaphthyl-2,2'-diamine (BINAM) ligand was purchased from GERCHEM chemicals, Hyderabad, India. Cu(OAc)2·H2O 30 was purchased from Merck, India and oven dried to obtain anhydrous Cu(OAc)2. Aryl halides, acid chlorides, alkynes and potassium ethyl xanthogenate were purchased from sigma Aldrich Chemical Company. All the solvents used for the reactions were obtained from Rankem, India and dried by 35 Vogel's procedure. Reaction temperatures were controlled by Varivolt temperature modulator, Thin-layer chromatography (TLC) was performed using Merck silica gel 60 F₂₅₄ precoated plates (0.25 mm) and visualized by UV fluorescence quenching. Silica gel (particle size 100-200 mesh) purchased from SRL India 40 was used for chromatography. ¹H and ¹³C NMR spectra were recorded on a Bruker 400 MHz instrument. ¹H NMR spectra were reported relative to Me₄Si (δ 0.0 ppm) or residual CHCl₃ (δ 7.26 ppm). ¹³C NMR were reported relative to CDCl₃ (δ 77.16 ppm). FTIR spectra were recorded on a Nicolet 6700 spectrometer and

45 are reported in frequency of absorption (cm⁻¹). High resolution mass spectra (HRMS) were recorded on O-Tof Micro mass spectrometer.

General procedure for one-pot synthesis of benzothiazoles

A mixture of N-(2-iodophenyl)benzamide 2 (161.5 mg, 0.5 50 mmol), Cu(OAc)₂ (9.1 mg, 0.05 mmol) and potassium ethyl xanthogenate 1 (240.4 mg, 1.50 mmol) were taken in an ovendried reaction tube equipped with a septum. The reaction tube was evacuated and back-filled with nitrogen. N, N-Dimethylformamide (3.0 mL) was added to the reaction mixture 55 at room temperature, the reaction tube was sealed with glass stopper and the reaction mixture was heated for 15 hours at 80 °C. Then 0.5 mL conc. HCl was added to the cooled reaction mixture. After 8 hours, 6 mL saturated aq.NaHCO3 was added and the mixture was extracted with ethyl acetate and water. The 60 organic layer was dried over anhydrous Na₂SO₄ and the solvent was removed under reduced pressure. The crude residue was purified by column chromatography on silica gel using ethyl acetate/hexanes as eluents to give desired product 2phenylbenzo[d]thiazole 3 (65.4 mg, 62%) as white solid.

65 Experimental procedure for trapping of aryl thiolate 28

A mixture of N-(2-Iodophenyl)pivalamide 14 (151.5 mg, 0.5 mmol), Cu(OAc)₂ (9.1 mg, 0.05 mmol) and potassium ethyl xanthogenate 1 (80.1 mg, 0.50 mmol) were taken in an ovendried reaction tube equipped with a septum. N, N-Dimethyl 70 formamide (3.0 mL) was added to the reaction mixture at room temperature, the reaction tube was sealed with glass stopper and the reaction mixture was heated for 10 hours at 80 °C. Then potassium ethyl xanthogenate 1 (160.3 mg, 1.0 mmol) and benzyl bromide (85.5 mg, 0.50 mmol) were added to the reaction ₇₅ mixture and the resulting mixture was further heated to 80 °C for 2.5 hours. The reaction mixture was extracted with ethyl acetate and water. The organic layer was dried over anhydrous Na₂SO₄ and then the solvent was removed under reduced pressure. The crude residue was purified by column chromatography on silica 80 gel using dichloromethane/ hexanes as eluents to give N-(2-(benzylthio)phenyl)pivalamide 28a (34.2 mg, 23%).

N-(2-(benzylthio)phenyl)pivalamide (28a). Pale yellow oil; R_f 0.23 (1:4 dichloromethane : hexanes); ¹H NMR (400 MHz, CDCl₃): δ 1.16 (s, 9H), 3.81 (s, 2H), 6.90-6.97 (m, 3H), 7.12-7.20 85 (m. 3H), 7.26 (t. J = 7.6 Hz. 1H), 7.35 (d. J = 8.0 Hz. 1H), 8.35 (d, J = 8.4 Hz, 1H), 8.68 (bs, 1H); ¹³C NMR (100 MHz, CDCl₃): δ 27.7, 40.3, 41.8, 119.9, 122.2, 123.9, 127.6, 128.8, 129.1, 130.4, 136.3, 137.8, 140.6, 176.8; FTIR (neat): 3362, 3062, 3029, 2960, 2926, 2869, 1684, 756, 698, 669 cm⁻¹; HRMS: m/z [M+H]⁺ 90 calcd for C₁₈H₂₂NOS: 300.1422; found: 300.1421.

Typical experimental procedure for domino synthesis of benzothiophenes

A mixture of Cu(OAc)₂ (9.1 mg, 0.05 mmol), BINAM (14.2 mg, 0.05 mmol) and potassium ethyl xanthogenate 1 (240.4 mg, 1.50 95 mmol) were taken in an oven dried reaction tube equipped with a septum. The reaction tube was evacuated and back-filled with nitrogen. 1-Iodo-2-(phenylethynyl)benzene 31 (159.1 mg, 0.50 mmol) and N,N-dimethylformamide (3.0 mL) were added to the reaction mixture at room temperature. The reaction tube was 100 closed with glass stopper and the reaction mixture was heated for 35 hours at 80 °C. Then, the reaction mixture was allowed to cool to room temperature and extracted with ethyl acetate and saturated NaCl solution. The organic layer was dried over anhydrous Na2SO4 and the solvent was removed under reduced 105 pressure. The crude residue was purified by column chromatography on silica gel using ethyl acetate/hexanes as eluents to give 2-phenylbenzo[b]thiophene 32 (101.0 mg, 96%) as white solid.

2-Phenylbenzo[b]thiophene (32). 15a White solid; mp 164-165 °C (lit. 164-166 °C); R_f 0.63 (in hexanes); ¹H NMR (400 MHz, CDCl₃): δ 7.30-7.40 (m, 3H), 7.44 (t, J = 8.0 Hz, 2H), 7.56 (s, 1H), 7.74 (d, J = 7.6 Hz, 2H), 7.79 (d, J = 7.6 Hz, 1H), 7.85 (d, J $_{5} = 8.0 \text{ Hz}, 1\text{H}; ^{13}\text{C NMR} (100 \text{ MHz}, \text{CDCl}_{3}): \delta 119.6, 122.4,$ 123.7, 124.5, 124.6, 126.6, 128.4, 129.1, 134.5, 139.7, 140.8, 144.4; IR (neat): 3052, 3027, 2924, 2855, 752, 731, 690 cm⁻¹; HRMS (m/z): $[M+H]^+$ calcd. for $C_{14}H_{11}S$: 211.0581; found: 211.0580.

2-p-Tolylbenzo[b]thiophene (34). White solid; mp 167-168 °C (lit. 166.1-168.2 °C); R_f 0.64 (in hexanes); ¹H NMR (400 MHz, CDCl₃): δ 2.28 (s, 3H), 7.11 (d, J = 8.0 Hz, 2H), 7.16-7.26 (m, 2H), 7.38 (s, 1H), 7.50 (d, J = 8.0 Hz, 2H), 7.64 (d, J = 7.6Hz, 1H), 7.70 (d, J = 7.6 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃): 15 δ 21.4, 118.9, 122.3, 123.5, 124.2, 124.6, 126.5, 129.7, 131.6, 138.4, 139.4, 140.9, 144.5; IR (neat): 3051, 3021, 2913, 2856, 808, 733, 721 cm⁻¹; HRMS (m/z): $[M+H]^+$ calcd. for $C_{15}H_{13}S$: 225.0738; found: 225.0742.

2-m-Tolylbenzo[b]thiophene (36). White solid; mp 116-²⁰ 118 °C (lit. 117-118 °C); R_f 0.73 (in hexanes); ¹H NMR (400 MHz, CDCl₃): δ 2.44 (s, 3H), 7.17 (d, J = 7.2 Hz, 1H), 7.29-7.39 (m, 3H), 7.52-7.56 (m, 3H), 7.78 (d, J = 7.6 Hz, 1H), 7.84 (d, J =7.6 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃); δ 21.6, 119.4, 122.4, 123.6, 123.7, 124.3, 124.6, 127.3, 128.9, 129.2, 134.3, 138.7, 25 139.6, 140.8, 144.5; IR (neat): 3056, 3027, 2921, 2854, 832, 786, 747 cm⁻¹; HRMS (m/z): $[M+H]^+$ calcd. for $C_{15}H_{13}S$: 225.0738; found: 225.0745.

2-(4-Methoxy-2-methylphenyl)benzo[b]thiophene (38).White solid; mp 68-69 °C; R_f 0.37 (in hexanes); ¹H NMR (400 30 MHz, CDCl₃): δ 2.47 (s, 3H), 3.85 (s, 3H), 6.79-6.84 (m, 1H), 6.86 (d, J = 2.4 Hz, 1H), 7.21 (s, 1H), 7.30-7.40 (m, 2H), 7.42 (d, J = 8.4 Hz, 1H), 7.78 (d, J = 8.0 Hz, 1H), 7.84 (d, J = 8.0 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃): δ 21.5, 55.4, 111.4, 116.3, 122.1, 122.7, 123.4, 124.0, 124.4, 126.8, 131.9, 138.1, 140.1, 35 140.4, 143.6, 159.7; IR (neat): 3052, 3001, 2962, 2932, 2835, 811, 744, 727 cm⁻¹; HRMS (m/z): $[M+H]^+$ calcd. for $C_{16}H_{15}OS$: 255.0844; found: 255.0836.

2-(4-Fluorophenyl)benzo[b]thiophene (40).¹⁸ White solid; mp 162 °C (lit. 162-164 °C); R_f 0.69 (in hexanes); ¹H NMR (400 40 MHz, CDCl₃): δ 7.09-7.16 (m, 2H), 7.30-7.40 (m, 2H), 7.47 (s, 1H), 7.65-7.71 (m, 2H), 7.77 (d, J = 7.2 Hz, 1H), 7.83 (d, J = 7.6Hz, 1H); 13 C NMR (100 MHz, CDCl₃): δ 116.1 (d, J = 21.8 Hz), 119.6, 122.4, 123.7, 124.5, 124.8, 128.3 (d, J = 8.0 Hz), 130.7, 139.6, 140.8, 143.2, 162.9 (d, J = 246.8 Hz); IR (neat): 3061, 45 3033, 821, 745, 727 cm⁻¹.

2-Cyclohexenylbenzo[b]thiophene (42). 15b White solid; mp 85-86 °C (lit. 84-86 °C); R_f 0.72 (in hexanes); ¹H NMR (400 MHz, CDCl₃): δ 1.57-1.64 (m, 2H), 1.69-1.76 (m, 2H), 2.13-2.20 (m, 2H), 2.39-2.45 (m, 2H), 6.23 (t, J = 4.0 Hz, 1H), 7.03 (s, 1H),50 7.14-7.23 (m, 2H), 7.56-7.60 (m, 1H), 7.65 (d, J = 7.2 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃): δ 22.2, 22.8, 25.9, 27.1, 117.9, 122.1, 123.3, 124.2, 124.3, 127.2, 131.7, 138.4, 140.6, 146.9; IR (neat): 3050, 3022, 2927, 2855, 2826, 1632, 817, 740, 722 cm⁻¹; HRMS (m/z): $[M+H]^+$ calcd. for $C_{14}H_{15}S$: 215.0894; found: 55 215.0903.

2-(Benzo[b]thiophen-2-yl)pyridine (44). White solid; mp 125-126 °C (lit. 126 °C); R₆ 0.55 (1:9 ethyl acetate: hexanes); ¹H NMR (400 MHz, CDCl₃): δ 7.18-7.23 (m, 1H), 7.32-7.39 (m, 2H), 7.73 (td, J = 8.0 & 2.0 Hz, 1H), 7.78-7.82 (m, 2H), 7.83 (s, 60 1H), 7.85-7.90 (m, 1H), 8.62-8.66 (m, 1H); ¹³C NMR (100 MHz, CDCl₃): δ 119.7, 121.2, 122.7, 124.2, 124.6, 125.2, 136.7, 140.6, 140.8, 144.9, 149.9, 152.7; IR (neat): 3045, 2991, 782, 752, 738 cm⁻¹.

Acknowledgments

65 We thank CSIR (01(2378)/10/EMR-II) and DST New Delhi, India for the financial support. D. J. C. P. thanks UGC, New Delhi, India for senior research fellowship. We thank DST, New Delhi for the funding towards the 400 MHz NMR instrument to the Department of Chemistry, IIT Madras under the IRPHA 70 scheme and ESI-MS facility under the FIST programme.

Graphical Abstract

Cu-catalyzed *in situ* Generation of Thiol Using Xanthate as Thiol Surrogate for the One-pot Synthesis of Benzothiazoles and Benzothiophenes

D. J. C. Prasad and G. Sekar*

A new copper-catalyzed *in situ* generation of aryl thiolates strategy was successfully developed for the one-pot synthesis of substituted benzothiazoles from 2-iodoanilides using xanthate as thiol precursor. A wide range of 2-iodoanilides with both electron-releasing and electron-withdrawing groups produced the corresponding benzothiazoles in good yields. Further, this one-pot protocol was successfully utilized for the synthesis of a potent antitumor agent 2-(3,4-dimethoxyphenyl)-5-fluorobenzo[*d*]thiazole (PMX 610). Finally, copper-catalyzed *in situ* generation of aryl thiolates strategy was successfully applied for the domino synthesis of substituted benzothiophenes from *o*-haloalkynyl benzenes using xanthate as thiol precursor.
